DETAILED ACTION

- 1. This action is responsive to communications: The Amendment forwarded to the examiner on 12/30/03 to the original Application and Information Disclosure Statement filed on 02/24/00.
- 2. Claims 1-9 and 12-24 remain rejected under 35 U.S.C. 103(a) as being unpatentable over Brown et al (US: 5,913,208, 06/15/99).
- 3. Claims 10-11 and 25-26 remain rejected under 35 U.S.C. 103(a) as being unpatentable over Brown et al (US: 5,913,208, 06/15/99) in view of Microsoft Press Computer Dictionary, Microsoft Press, 1997, pp. 309.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 1-9 and 12-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown et al (US: 5,913,208, 06/15/99).
- -As per independent claim 1, Brown et al teach a method for identifying duplicate documents, where having *received said documents* generating a hit-list (Fig. 3b) of intrinsic and non intrinsic attributes (title, author, creation date, length, size, location, abstract, etc (columns 1

Art Unit: 2178

and 6, lines 64-67 and 51-54)) wherein the table structure (equivalent to metadata summary subtrees) of the attributes of each document pair are compared (i.e. if one document is missing an attribute structure then the documents are considered distinct) and each document is shown to be distinct from the other if their respective attributes aren't equal (Fig. 4: 430 & 450). Brown et al do not disclose that the summary hit-list contain metadata. It was well known in the art that document attributes such as title, size, location, etc are considered metadata of a document. Brown et al also do not disclose that the summary hit-list includes a sub-tree structure. It would have been obvious to one of ordinary skill in the art, to have used Brown et al method of comparing hit-lists of attributes and used the structural relations of those hit-list attributes as the first determinate of distinct documents, because while both methods provide the same benefit of identifying distinct documents, by checking the structure (layout) of those attributes first, it can

Page 3

-As per dependent claim 2, Brown et al further disclose wherein the table structure contains intrinsic and non intrinsic attributes (title, author, creation date, length, size, location, abstract, etc (columns 1 and 6, lines 64-67 and 51-54)) to be compared.

more quickly be established with the minimum amount of comparisons that the compared

has A before B and the other B before A they are considered distinct.)

documents are distinct of one another (i.e. both documents have structures A & B, but since one

-As per dependent claim 3, Brown et al further disclose that one of the attributes used for determination could be an abstract or a title (text-content)(column 6, lines 51-54).

Art Unit: 2178

-As per dependent claim 4, Brown et al further disclose and that one of the attributes used for determination could be an abstract or a title (text-content)(column 6, lines 51-54).

-As per dependent claim 5, Brown et al further disclose noting the current pair of hit-list documents as duplicates if the text content are *equal* (i.e. the structure and non-text attributes have been compared but alone can not determine duplicates) (Fig. 4: 460).

-As per dependent claim 6, Brown et al further disclose one embodiment of *deleting* duplicates from the hit list group (column 8, lines 20-22: Fig. 8).

-As per dependent claims 7-9, Brown et al further disclose that in the hit-list (metadata table) when an entry is identified as having one or more duplicates......is cross referenced in the duplicate identifier field of the other duplicate (column 8, lines 11-16), wherein for two metadata entries the *entry number and duplicate identifier field constitute a 2x2 matrix* (Fig. 3b). Brown et al also teach that the process of identifying duplicates as distinct is achieved by comparing the metadata structures, attributes, and text content of the attributes as seen in claims 1-3. Brown et al do not teach storing a zero binary value in the first row and second column position of the matrix to designate that the first and second documents are distinct. It would have been obvious to one of ordinary skill in the art, to have used a binary indicator (0 or 1) in Brown et al duplicate identifier position concerning only two documents, because while Brown et al is set up for a plurality of documents which could lead to many multiple dependencies, if a restriction of only comparing two documents was applied to Brown et al, there would be no need for more than one

Art Unit: 2178

indicator (0 or 1) to clearly state the relationship between the first document and second document.

-As per independent claim 12, Brown et al teach a system wherein a search engine process produces a hit-list (metadata parser) (Abstract), where it has already been stated above that the hit-list contains metadata (i.e. structure, attributes, and some text content), wherein a hit-list formatter processor selects one or more of......duplicate instances of one another (summary consolidator)(Abstract) with the ability of the formatter processor to delete duplicates from he hit list group (repository) (column 8, lines 20-22: Fig. 8). Brown et al also teach wherein the generated summary hit-lists are stored (in a repository) (Fig. 1 and Fig. 4: 410)

-As per dependent claim 13, Brown et al further teach that the formatter processor (summary consolidator)(Fig. 4: 420 & 440) is configured to compare the metadata attributes values of the hit-lists (metadata summaries) and compare the text content (i.e. abstract or title) included in the metadata attribute hit-lists. As shown in claim 1, Brown et al does not show that its formatter is configured to compare the structures of the metadata hit lists. It would have been obvious to one of ordinary skill in the art, to have used Brown et al method of comparing hit-lists of attributes and used the structural relations of those hit-list attributes as the first determinate of distinct documents, because while both methods provide the same benefit of identifying distinct documents, by checking the structure (layout) of those attributes first, it can more quickly be established with the minimum amount of comparisons that the compared documents are distinct

Art Unit: 2178

of one another (i.e. both documents have structures A & B, but since one has A before B and the other B before A they are considered distinct.)

-As per dependent claims 14-16, Brown et al further teach wherein the system is configured to compare the attribute values included in the hit-lists, the text content included in the metadata hit-lists, and the metadata portion of the hit-list.

-As per independent claim 17 and dependent claims 18 and 19, Brown et al teach the method of classifying electronically posted documents of claim 1-3 respectively. Brown et al does not teach that the method is a program product to be executed by a computer system stored in a computer readable medium. It was well known in the art to convert a method for use by a computer system to a program product so that that method can be executed on said system and any other systems that can execute the program. It was also well known in the art that a computer system for executing said program product would have a recordable media (memory).

-As per dependent claim 20, Brown et al further teach identifying documents as duplicates if text content of the metadata hit-lists (i.e. abstract or title) are equivalent (i.e. the structure and non-text attributes have been compared but alone can not determine duplicates) (Fig. 4: 460).

-As per dependent claim 21, Brown et al further teach removing the duplicate metadata hit-list from the group (column 8, lines 20-22; Fig. 8).

Art Unit: 2178

-As per dependent claims 22-24, Brown et al further teach the hit-list (metadata table) when an entry is identified as having one or more duplicates......is cross referenced in the duplicate identifier field of the other duplicate (column 8, lines 11-16), wherein for two metadata entries the *entry number and duplicate identifier field constitute a 2x2 matrix* (Fig. 3b). Brown et al also teach that the process of identifying duplicates as distinct is achieved by comparing the metadata structures, attributes, and text content of the attributes as seen in claims 1-3. Brown et al do not teach storing a zero binary value in the first row and second column position of the matrix to designate that the first and second documents are distinct. It would have been obvious to one of ordinary skill in the art, to have used a binary indicator (0 or 1) in Brown et al duplicate identifier position concerning only two documents, because while Brown et al is set up for a plurality of documents which could lead to many multiple dependencies, if a restriction of only comparing two documents was applied to Brown et al, there would be no need for more than one indicator (0 or 1) to clearly state the relationship between the first document and second document.

6. Claims 10-11 and 25-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown et al (US: 5,913,208, 06/15/99) in view of Microsoft Press Computer Dictionary, Microsoft Press, 1997, pp. 309.

-As per independent claim 10, Brown et al teach the method of claim 1 as stated above, and further disclose receiving not just two, but *two or more entries* (column 3, lines 54-55) of documents and generating metadata hit-list summaries for each received document. Brown et al do not teach that when receiving a plurality of documents to group the metadata hit-list

Art Unit: 2178

Summaries according to the mime-type designation of each document. The Microsoft Press

Computer Dictionary teaches us that MIME-types describe the contents of a document which can
be used to interpret the content of a file over the internet (pp. 309). It would have been obvious
to one of ordinary skill in the art, to have used Brown et al method for identifying duplicate
documents from search results without comparing document content and grouping the hit-list
summaries by MIME-type, because documents of different MIME-types wouldn't have to be
compared as their intrinsic attributes would be wholly different, i.e. a regular text/plain MIMEtype couldn't be a duplicate of a text/html MIME-type, and thus this would increase efficiency
by significantly reducing the number of hit-list summary comparisons.

-As per dependent claim 11. Brown et al and the Microsoft Press Computer Dictionary do not teach grouping more subsets of hit-list summaries by MIME-type. As it was taught above in claim 10, it would have been obvious to have grouped as many MIME-type subsets as were required by the plurality of documents for the purpose of increased efficiency by significantly reducing the number of hit-list summary comparisons across MIME-types.

-As per independent claim 25, Brown et al teach the method for classifying electronically posted documents of claim 10 as stated above. Brown et al do not teach that the method is a program product to be executed by a computer system stored in a computer readable medium. It was well known in the art to convert a method for use by a computer system to a program product so that that method can be executed on said system and any other systems that can

Page 8

Art Unit: 2178

execute the program. It was also well known in the art that a computer system for executing said program product would have a recordable media (memory).

-As per dependent claim 26. Brown et al does not teach grouping more subsets of hit-list summaries by MIME-type. As it was taught above in claim 25, it would have been obvious to have grouped as many MIME-type subsets as were required by the plurality of documents for the purpose of increased efficiency by significantly reducing the number of hit-list summary comparisons across MIME-types.

Response to Arguments

7. Applicant's arguments filed 12/30/03 have been fully considered but they are not persuasive.

-In regard to independent claims 1, 10 12, 17, and 25, the Applicant argues that the Brown et al reference does not disclose generating a metadata summary for a first document and a second document, wherein each metadata summary includes a sub-tree and each sub-tree including a plurality of list items, comparing the list items of the summary sub-trees and identifying the two documents as distinct if the list items of the summary sub-trees are not equivalent. As stated above in the rejection of said independent claims, Brown et al teach generating a metadata summary for a plurality of documents (hit-list: Fig. 3b) of intrinsic and non intrinsic attributes (title, author, creation date, length, size, location, abstract, etc (columns 1 and 6, lines 64-67 and 51-54)) wherein the row entries in the hit-list table structure are equivalent to metadata summary sub-trees for individual documents, and wherein each document row (sub-

Art Unit: 2178

tree) includes a plurality of intrinsic and non-intrinsic attributes (equivalent to list-items). Brown et al also teach wherein the attributes of each document pair are compared (i.e. if one document is missing an attribute structure then the documents are considered distinct) and each document is shown to be distinct from the other if their respective attributes aren't equal (Fig. 4: 430 & 450).

-In regard to all the dependent claims, the Examiner notes that as the independent claims remain rejected as shown above, the dependent claims do not distinguish over the prior art and their original rejections are still applied.

Conclusion

8. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Adam L Basehoar whose telephone number is (703) 305-7212. The examiner can normally be reached on M-F: 7:30am - 4:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Heather Herndon can be reached on (703) 308-5186. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
